

Higgsfield.ai — rebuilt in 24 hours

Zain Khan · 8x Software Engineer assignment · September 2026

Live	higgsfield-rebuild-delta.vercel.app — works with no sign-in; every visitor gets 100 credits
Repo	github.com/zainkhan121212/higgsfield-rebuild — public, with .agent-logs/ and CAPTURE-TEST.md
Docs	docs/PLAN.md (decisions), docs/SECURITY.md (security), docs/recon/notes.md (product recon), docs/WALKTHROUGH.md

The one deliberate change

On higgsfield.ai a free account cannot press Generate — every attempt opens a paywall. Here a guest gets 100 real credits and can generate in the first ten seconds. Everything else is rebuilt to match the original's shape.

What is real

- **Image generation** — real FLUX renders from the prompt (Pollinations keyless endpoint; switches to fal.ai when a key is set). 17 image models mapped with per-model style.
- **Credits and jobs** — priced before you click, debited in a transaction, queued → running → done, polled by the client, refunded on failure. Ledger on /account.
- **Studios** — Image studio (model picker, ratio/quality/resolution/batch) and Video studio (22 presets, references, duration/ratio/resolution, history).
- **Preview before you pay** — in the video studio: 1 credit buys four stills of the shot; pick one and it becomes the video's first frame (image-to-video when a real key is set).
- **Accounts** — guest-first; email + password sign-up upgrades the guest so nothing is lost; passkeys (WebAuthn) for passwordless login; notifications; assets with favorites and folders; public share pages.
- **Checkout** — review → card form → processing → receipt with order number and credit grant. Test card; nothing is charged; card data never leaves the browser.
- **Every nav page** — MCP, ChatGPT Plugin, Genjutsu, Effects, Cinema Studio, Marketing Studio, Supercomputer, 3D Jutsu, Edit, Academy, Community, Contests, Plugins, Canvas, Originals, Enterprise, Pricing.

What is simulated (and labelled as such in the UI)

- **Video models** — the pipeline, credits, polling and history are real; the returned clip is a sample matched to the preset. No free text-to-video API fit in 24 hours. Setting FAL_KEY + VIDEO_MODE=real switches to real generation.
- **Payments** — demo checkout, no payment provider. **Google OAuth** — not wired (passkeys cover passwordless).

Security measures (details in docs/SECURITY.md)

- Passkeys (FIDO2/WebAuthn) with counter checks · signed, expiring __Host- session cookie with rotation · cross-site writes blocked at the edge via Fetch Metadata (CSRF) · per-request nonce Content-Security-Policy with strict-dynamic, HSTS preload, frame-ancestors none, COOP, Permissions-Policy.
- Postgres-backed rate limits that hold across serverless regions · login lockout after 5 failures per email/IP · guest-creation cap per IP (the free-credit-farming control) · bcrypt-12 with leaked-password refusal · zod validation and 64 KB body cap on every endpoint · ownership checks on every mutation · append-only audit trail shown on /account.

Left out on purpose

Audio, Canvas editor, Edit/Layers processing, Motion Control, real payments, email verification, OAuth, business plans. Media on the landing pages is Higgsfield's own, hotlinked for review only after checking with the 8x team; it sits behind one switch and the free-license fallback is one flag away.

Stack and process

Next.js 16 (App Router) · TypeScript · Tailwind v4 · Prisma + Supabase Postgres · Vercel (Sydney, next to the database) · fal.ai / Pollinations for images. Built with Claude Code; every prompt and final response is captured by a hook into .agent-logs/ and committed alongside the code (see CAPTURE-TEST.md). 30+ commits in order of work.

Generated from the repository docs on submission day. Live site may show simulated video until a paid video API key is configured.
