

Pictures, set in *loose type*.

Pied turns a photograph, a drawing or a sentence into a picture made of thousands of letters that scatter when your cursor passes and spring back home. You can colour it, light it as neon or an LED board, paint on the letters, and keep it as a **live desktop wallpaper** that still reacts to the cursor.

I · SOURCE

Write, draw, upload

II · SET

Type or LED board

III · PAINT

Brush, words, stamps

IV · KEEP

Wallpaper & exports

WHAT IT DOES

- **Write a sentence** — fal.ai FLUX paints it from a server-side brief, then it's auto-framed and set in type
- **Draw** with a mouse or finger, or **upload** a photo (read in the browser, never uploaded)
- Set in your own words or a density ramp; 3 typefaces; 60–240 columns
- Colour, **neon**, or an **LED board** in amber, green, red, white or full colour
- Paint on the letters: brush, spray, word brush, ornament stamps; ink, neon or foil finish

ON YOUR DESKTOP

- One self-contained **.html wallpaper**, plus a kit for Lively, Wallpaper Engine and Plash
- **Desktop Studio**: drag a clock, calendar, countdown, verse, note, now-playing record or FPS onto it — all drawn in letters or LED lamps
- **Live weather** for your city as a looping scene: sun, clouds, rain, snow, storms, moon and stars
- Slideshows that morph, a type clock, dance to music, tilt on phones
- Also exports 4K PNG, MP4 and GIF

HOW IT'S BUILT

- **Next.js 16, React 19, TypeScript**; a hand-written canvas engine (every letter a particle on a spring, 60 fps) shared by the site and the wallpaper
- **Postgres** accounts, library, gallery, remix, Plate of the Day
- **Security**: nonce CSP, HSTS, CSRF tokens, hashed sessions, lockouts, rate & spend limits, IDOR checks, audit log
- Screen-reader descriptions of every plate; reduced-motion support
- Deployed on **Vercel** with Neon Postgres
